1. INTRODUCTION

Ecology and Environment, Inc., Field Investigation Team (FIT) was tasked by the United States Environmental Protection Agency (U.S. EPA) to conduct a screening site inspection (SSI) of the Golf and River Landfill site under contract number 68-01-7347.

The site was initially discovered by the Illinois Department of Public Health (IDPH) after the landfill's operator, Sanitary Improvement Company, filed an Application for Registration of a Refuse Disposal Site or Facility on July 28, 1969 (IDPH 1969). On June 8, 1981, Sanitary Improvement Company and Arc Disposal Company, Inc., a waste transporter, filed a Notification of Hazardous Waste Site form in accordance with section 103(c) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980.

The site was evaluated in the form of a preliminary assessment (PA) that was submitted to U.S. EPA. The PA was prepared by Gregory W. Dunn of the Illinois Environmental Protection Agency (IEPA) and is dated January 28, 1987.

FIT prepared an SSI work plan for the Golf and River Landfill site under technical directive document (TDD) F05-8710-030, issued on October 9, 1987. The SSI work plan was approved by U.S. EPA on November 23, 1988. The SSI of the Golf and River Landfill site was conducted on April 4, 1989, under TDD F05-8710-030, reissued on January 12, 1989.

The FIT SSI included two interviews with a site representative, a reconnaissance inspection of the site, and the collection of six soil/sediment samples.

The purposes of an SSI have been stated by U.S. EPA in a directive outlining Pre-Remedial Program strategies. The directive states:

> All sites will receive a screening SI to 1) collect additional data beyond the PA to enable a more refined preliminary HRS [Hazard Ranking System] score, 2) establish priorities among sites most likely to qualify for the NPL [National Priorities List], and 3) identify the most critical data requirements for the listing SI step. A screening SI will not have rigorous data quality objectives (DQOs). Based on the refined preliminary HRS score and other technical judgement factors, the site will then either be designated as NFRAP [no further remedial action planned], or carried forward as an NPL listing candidate. A listing SI will not automatically be done on these sites, however. First, they will go through a management evaluation to determine whether they can be addressed by another authority such as RCRA [Resource Conservation and Recovery Act].... Sites that are designated NFRAP or deferred to other statutes are not candidates for a listing SI.
>
> The listing SI will address all the data requirements of the revised HRS using field screening and NPL level DQOs. It may also provide needed data in a format to support remedial investigation work plan development. Only sites that appear to score high enough for listing and that have not been deferred to another authority will receive a listing SI. (U.S. EPA 1988)

U.S. EPA Region V has also instructed FIT to identify sites during the SSI that may require removal action to remediate an immediate human health or environmental threat.

2. SITE BACKGROUND

2.1 INTRODUCTION

This section presents information obtained from SSI work plan preparation and the site representative interviews.

2.2 SITE DESCRIPTION

The Golf and River Landfill site is an inactive, trench-type landfill where mixed municipal wastes were deposited (IEPA 1969, 1987; U.S. EPA 1981, 1981a).

The site is located on approximately 20 acres of land behind The Sisters of the Holy Family of Nazareth Convent, in an area of mixed residential, recreational, and commercial land use. The site is located 1/4 mile north of the intersection of Golf and Des Plaines River roads, in Cook County, Des Plaines, Illinois (E1/2 sec. 8 and W1/2 sec. 9, T.41N., R.12E.) (see Figure 2-1 for site location).

The landfill is bordered by the Des Plaines River on its eastern and southern sides, and All Saints Cemetery is located directly north of the site. A 4-mile radius map of the Golf and River Landfill site is provided in Appendix A.

2.3 SITE HISTORY

The site property is currently owned by The Sisters of the Holy Family of Nazareth Convent. At the time of the SSI, Sister Janet Marie, treasurer of the convent, possessed the most information regarding previous and current waste disposal practices at the site. Sister Janet

FIGURE 2-1 SITE LOCATION

Marie stated that the convent has owned the site property for 100 years (Marie 1989). According to Sister Janet Marie, the site is currently inactive. At the time of the SSI, however, evidence of recent dumping of mixed municipal debris at the site was noted by FIT.

Landfill operations began at the Golf and River Landfill site circa 1955, when Sanitary Improvement Company leased the site property from the convent in order to operate a landfill, and hired Arc Disposal Company, Inc., to transport wastes to the landfill (Marie 1989). The owner of Sanitary Improvement Company was Edward De Boer, and its operator was Charles Heart (IDPH 1966). Prior to the opening of the landfill, the site property was used to grow alfalfa (Marie 1989).

Initially, only mixed municipal wastes were accepted at the site (IEPA 1987; U.S. EPA 1981, 1981a). Records were not available for waste deposited at the landfill before 1966 (IEPA 1987). The landfill encompassed approximately 20 acres and was approximately 30 feet deep (IDPH 1966).

On July 28, 1969, the landfill operator filed an Application for Registration of a Refuse Disposal Site or Facility with IDPH (IDPH 1969; IEPA 1987). The landfill ceased receiving refuse in approximately 1970, after Sanitary Improvement Company and the convent could no longer agree upon terms for the lease (De Boer 1970; IEPA 1987; Marie 1989).

According to information obtained from a solid waste disposal field inspection report conducted by IEPA on August 29, 1969, a final cover of 24 inches of unknown material had been applied to the landfill at the time of the inspection (IEPA 1969). Sanitary Improvement Company, under the supervision of IEPA and/or IDPH, reportedly applied the required final cover (De Boer 1970; IEPA 1969, 1970). The Sanitary Improvement Company dissolved around this time (U.S. EPA 1981).

Lack of daily cover was the only violation cited at the site during its operation, and no hazardous wastes were recorded to have been disposed of at the site (IEPA 1969, 1987). Two to three years after the landfill was closed, erosion began exposing pieces of concrete and boulders contained in the landfill (Marchiori 1989). J. S. Adams Company, a construction company hired by the convent to repair and maintain its building and grounds for the past 20 to 25 years, began bringing in clean soil and clay from its various excavations to deposit on

the landfill (Marchiori 1989; Marie 1989). The clay and soil applied to the landfill by J. S. Adams Company amounted to approximately 35 to 40 truckloads (Marchiori 1989).

In approximately 1983, the Northwest Water Commission (NWC), located in Des Plaines, Illinois, excavated the southern portion of the landfill in order to install water lines (Marie 1989; Sturgell 1989a). The water lines, which currently run from the Evanston water plant west to Palatine and north to Buffalo Grove, were installed at a depth of 6 feet (Sturgell 1989a). A cathodic testing station, installed to insure that the water lines are not corroded by soils, is located at the landfill (Sturgell 1989). The installation of this testing station is not specific to the Golf and River Landfill site, but is a standard procedure with all water lines (Sturgell 1989). In 1986, the Des Plaines River flooded the site and destroyed a retreat center building located west of the landfill (Machalski 1989; Marie 1989).

Since the landfill was closed and covered in 1970, apparently under the supervision of IEPA and/or IDPH, there have been no other state regulatory response activities at the site.

3. SCREENING SITE INSPECTION PROCEDURES AND FIELD OBSERVATIONS

3.1 INTRODUCTION

This section outlines procedures and observations of the SSI of the Golf and River Landfill site. Individual subsections address the site representative interviews, reconnaissance inspection, and sampling procedures. Rationales for specific FIT activities are also provided. The SSI was conducted in accordance with the U.S. EPA-approved work plan.

The U.S. EPA Potential Hazardous Waste Site Inspection Report (Form 2070-13) for the Golf and River Landfill site is provided in Appendix B.

3.2 SITE REPRESENTATIVE INTERVIEWS

Andrea L. Davis, FIT team leader, conducted a telephone interview with Sister Janet Marie, treasurer of The Sisters of the Holy Family of Nazareth Convent, on March 29, 1989, at approximately 10:30 a.m. The interview was conducted to gather information that would aid FIT in conducting SSI activities. Sister Janet Marie was also briefly interviewed at the convent before the reconnaissance inspection on April 4, 1989. Michael McAteer of FIT was also present at this time.

3.3 RECONNAISSANCE INSPECTION

FIT conducted a reconnaissance inspection of the Golf and River Landfill site on April 4, 1989, at approximately 10:15 a.m. in accordance with Ecology and Environment, Inc. (E & E), health and safety guidelines. The reconnaissance inspection included a walk-through of the site to determine appropriate health and safety requirements for

conducting on-site activities and to make observations to aid in characterizing the site. Mitch Levin of IEPA accompanied FIT on the reconnaissance inspection from approximately 10:15 to 11:00 a.m. Site representatives did not accompany FIT during the reconnaissance inspection.

Reconnaissance Inspection Observations. The area surrounding the site is of even topographical relief, except along the Des Plaines River, where the ground surface slopes down approximately 30 feet from the top of the landfill to the river. The river borders the site on its southern and eastern sides (see Figure 3-1 for site features). Trees and shrubs were observed growing along the river banks, which were relatively steep. The Des Plaines river is slow moving and turbid.

Evidence of beavers was observed on trees along the river banks. Canada geese were also observed on the landfill. According to Sister Janet Marie, both deer and groundhogs have been observed on the landfill in the past (Marie 1989).

The area to the northeast of the site, beyond the Des Plaines River, is designated as forest preserve. All Saints Cemetery borders the site to the north, and the buildings that make up The Sisters of the Holy Family of Nazareth Convent are located to the west of the site. A drainage ditch, approximately 3 feet deep, runs along the site's northern border. The ditch appears to drain into the Des Plaines River. At the time of the SSI, the ditch was filled with approximately 6 inches of water. The landfill, which was covered with grass and appeared to have been recently mowed, slopes gradually down toward the convent building on its western side. The convent buildings include a convent and attached retreat center, a shrine, a maintenance shed, and a boiler room building. FIT also observed the dirt foundation of the former retreat center to the east of the convent buildings. The convent's current retreat center and the landfill are separated by a paved access road that completely surrounds the convent building. In the northeastern corner and along the eastern bank of the landfill, FIT observed mixed municipal debris including plastic containers, tires, pipes, chairs, buggies, and metal drums marked "Department of Civil Defense." Areas on top of the landfill were slightly eroded. Because of the season, FIT could not determine whether stressed vegetation was present in the

FIGURE 3-1 SITE FEATURES

landfill area. On the landfill's southeastern slope, a gravel area containing erosional gullies covers an area of approximately 30 square feet. On the southern portion of the landfill, a sign, indicating the location of the cathodic testing station, has been erected by NWC. The site is not surrounded by fencing and is accessible. Photographs of the Golf and River Landfill site are provided in Appendix C.

3.4 SAMPLING PROCEDURES

Samples were collected by FIT at locations selected during the reconnaissance inspection to determine whether U.S. EPA Target Compound List (TCL) compounds and U.S. EPA Target Analyte List (TAL) analytes were present at the site. The TCL and TAL, with corresponding quantitation/detection limits, are provided in Appendix D.

On April 4, 1989, FIT collected two surface and three subsurface soil/sediment samples from suspected areas of contamination and one subsurface background soil sample. Portions of each soil/sediment sample were offered to the site representative, but the offer was declined.

Soil/Sediment Sampling Procedures. Subsurface soil sample S1 was collected from the northern edge of the landfill near the drainage ditch that runs along the site's northern border (see Figure 3-2 for soil/sediment sampling locations). Sample S1 was collected at a depth of approximately 20 inches using a posthole digger. Soil sampling location S1 was chosen because of the possibility of surface water runoff from the landfill to the drainage ditch.

Surface soil sample S2 was collected in the northeastern corner of the landfill with a hand trowel at a depth of approximately 1 to 6 inches. Sample S2 was collected in an area where debris had been recently deposited. Subsurface soil sample S3 was collected from the eastern slope of the landfill, almost at the Des Plaines River. The sample was collected with a posthole digger at a depth of approximately 12 inches. Sampling location S3 was chosen because of the possibility of surface water runoff from the landfill migrating toward the river. The location was also chosen because of its proximity to some municipal debris, including medium-sized plastic and metal containers.

Sediment sample S4 was collected at the edge of the Des Plaines River, along the eastern edge of the landfill. Sample S4 was collected

LEGEND

▲ SOIL SAMPLE ▼ SEDIMENT SAMPLE

FIGURE 3-2 SOIL/SEDIMENT SAMPLING LOCATIONS

with a posthole digger at a depth of approximately 12 inches. Sampling location S4 was chosen because of the possibility that contamination from the landfill had migrated, via surface water runoff, into the Des Plaines River and had accumulated in river sediments.

Surface soil sample S5 was collected from an erosional gully on the southeastern edge of the landfill that led from the landfill to the bank of the Des Plaines River. The sample was collected with a hand trowel, at a depth of approximately 1 to 6 inches, from the end of the erosional gully.

A background soil sample (indicated as S6) was collected from a grassy area near some trees on the southwestern portion of the convent property. Subsurface soil sample S6 was collected with a posthole digger at a depth of approximately 12 inches. The background sample was collected from an area that appeared to be relatively undisturbed, in order to determine the representative chemical content of the soil in the area surrounding the site.

The soil/sediment from each surface soil sampling location was mixed together with the hand trowel in the hole from which it was collected so that a homogenous, representative sample could be obtained. Sample material was then transferred to sample bottles using the hand trowel. The volatile organic portion of each sample was transferred directly to a sample bottle, packaged, and sealed, without mixing (E & E 1987).

Subsurface soil samples were transferred from the hole to a stainless steel bowl. Sample material was mixed together, then transferred directly to sample bottles (E & E 1987).

Standard E & E decontamination procedures were adhered to during the collection of all soil/sediment samples. The procedures included the scrubbing of all equipment (e.g., posthole diggers, trowels, and bowls) with a solution of Alconox detergent and distilled water, and triple-rinsing the equipment with distilled water before the collection of each sample (E & E 1987). All soil/sediment samples were packaged and shipped in accordance with U.S. EPA-required procedures.

As directed by U.S. EPA, all soil/sediment samples were analyzed under the U.S. EPA Contract Laboratory Program (CLP) for TCL compounds

by Environmental Control Technology of Ann Arbor, Michigan, and for TAL analytes by Skinner and Sherman, Inc., of Waltham, Massachusetts.

4. ANALYTICAL RESULTS

4.1 INTRODUCTION

This section presents results of chemical analysis of FIT-collected soil/sediment samples for TCL compounds and TAL analytes.

4.2 RESULTS OF CHEMICAL ANALYSIS OF FIT-COLLECTED SAMPLES

Chemical analysis of FIT-collected soil/sediment samples revealed substances from the following groups of TCL compounds: polyaromatic hydrocarbons (PAHs), aromatics, pesticides, and common laboratory artifacts. Chemical analysis of FIT-collected soil/sediment samples also revealed the presence of TAL analytes, including heavy metals, metals, and soil and sediment constituents common to the area (see Table 4-1 for complete chemical analysis results of FIT-collected soil/sediment samples).

U.S. EPA quantitation/detection limits used in the analysis of FIT-collected soil/sediment samples are provided in Appendix D.

J	Value is above CRDL and is an estimated value because of a QC protocol.	Value may be semiquantitative.

5. DISCUSSION OF MIGRATION PATHWAYS

5.1 INTRODUCTION

This section contains a discussion of data and information that apply to potential migration pathways and targets of TCL compounds and TAL analytes that may be attributable to the Golf and River Landfill site.

The five migration pathways of concern discussed are groundwater, surface water, air, fire and explosion, and direct contact.

5.2 GROUNDWATER

The geology in the vicinity of the Golf and River Landfill site is characterized by various layers of glacial drift that overlie the Des Plaines Disturbance, an area of intense faulting within the bedrock (Willman 1971).

The Des Plaines Disturbance encompasses an area approximately 5 1/2 miles in diameter (Willman 1971). The Golf and River Landfill site is located slightly to the northwest of the center of the Des Plaines Disturbance (Willman 1971).

The glacial drift varies in thickness from approximately 125 to 280 feet in the vicinity of the Des Plaines Disturbance. The glacial drift consists of clayey till deposits with low permeabilities that overlie relatively thin sand and gravel outwash deposits. Existing well logs indicate the presence of a clay, combination clay/gravel, or sandy clay layer above the sand/gravel layer. One of the well logs indicates the presence of sand/gravel layers both above and below the clay/gravel layer. The clay containing layer is between 90 and 157 feet thick,

depending on location. Surficial deposits in the immediate vicinity of the site are primarily postglacial valley train deposits of the Des Plaines River (Walter H. Flood and Company, Inc. no date; Willman 1971).

Drinking water is obtained from gravel, limestone, and shale in the vicinity of the site (well logs of the area are provided in Appendix E). According to area well logs, the aquifer of concern is located at a depth of 124 feet. Because sand and gravel deposits directly overlie bedrock, the sand and gravel and bedrock aquifers are assumed to be hydraulically connected and constitute a single aquifer of concern (Walter H. Flood and Company, Inc. no date). Hydraulic connection of the bedrock aquifer is likely near the site because bedrock aquicludes in the area of the Des Plaines Disturbance potentially are not continuous.

In an area approximately 5/8 miles north of the site, where Silurian dolomite is the uppermost bedrock unit, groundwater flow direction is toward the east (Walter H. Flood and Company, Inc. no date). In the area of the site, however, the uppermost bedrock unit is believed to be Mississippian (Willman 1971). Because of the complex stratigraphy in the area of the Des Plaines Disturbance, groundwater flow may be highly variable. Any aquifer below the glacial till should be considered the aquifer of concern.

In accordance with the U.S. EPA-approved work plan, FIT did not collect groundwater samples during the SSI. The closest well to the Golf and River Landfill site is located 3/4 miles east of the site in an unincorporated area.

A potential exists for TCL compounds and TAL analytes detected on-site to migrate to groundwater in the vicinity of the site, based on the following information:

- Previous file information does not indicate the presence of a man-made liner at the site; and

- TCL compounds and TAL analytes were detected in on-site soils at depths of 1 to 6 inches.

However, the potential for TCL compounds and TAL analytes to migrate to the aquifer of concern in the vicinity of the site is low, based on the following geological information:

- The site is situated in a floodplain, near a bank of the Des Plaines River, so that shallow groundwater flow would likely be toward the river; and

- A low-permeability, clayey till unit between 90 and 157 feet thick lies between the landfill and the aquifer of concern.

Portions of six cities fall within a 3-mile radius of the Golf and River Landfill site (United States Geological Survey [USGS] 1963). These cities are Des Plaines, Glenview, Mount Prospect, Niles, Park Ridge, and Prospect Heights. Unincorporated areas are also located to the north, east, and southeast of the site. Of these, only Mount Prospect, Prospect Heights, and parts of the unincorporated areas obtain drinking water from private and/or municipal wells screened in the aquifer of concern at depths between approximately 100 and 400 feet. Within Mount Prospect, approximately eight private residential wells are in use within a 3-mile radius of the site (McIntosh 1989). These eight wells were multiplied by the persons-per-household average for Cook County (2.75) to obtain a total of 22 persons who are served by groundwater in Mount Prospect.

Within Prospect Heights, approximately 1,944 persons obtain drinking water from the Rob Roy municipal well system. This figure was obtained by multiplying the 2.75 persons-per-household average for Cook County by the approximately 707 homes served by this municipal well system (Dobner 1989). Added to this was a house count, obtained from USGS topographic maps, of the number of private residential wells in Prospect Heights (USGS 1963) (150) multiplied by the 2.75 persons-per-household average for Cook County (U.S. Bureau of the Census 1982), for a total of 2,357 persons served by groundwater in Prospect Heights.

Within the unincorporated areas, 12 persons are served by a shallow (approximately 250 feet) well at the Villa Redeemer Monastery (Benson

1989). Also included in the groundwater target population for the unincorporated areas are 113 persons obtaining groundwater from private residential wells. This figure was derived from a USGS house count of the unincorporated areas (USGS 1963) (41) multiplied by the 2.75 persons-per-house average for Cook County (U.S. Bureau of the Census 1982). The total groundwater target population for the unincorporated areas within a 3-mile radius of the site is 125 people. A total of approximately 2,504 persons are served by groundwater within a 3-mile radius of the Golf and River Landfill site.

5.3 SURFACE WATER

FIT did not sample surface water at the SSI stage, but a potential does exist for TCL compounds and TAL analytes to migrate to surface water, based on the following information:

- The Golf and River Landfill is bordered on its eastern and southern sides by the Des Plaines River;
- The landfill is susceptible to flooding by the Des Plaines River every spring and/or fall (Marie 1989);
- Although 24 inches of cover material was applied to the landfill at closure, the nature of the cover material is unknown and, according to J. S. Adams Company, erosion of the material was occurring 2 to 3 years later (Marchiori 1989); and
- Although 35 to 40 truckloads of clean earth and clay material were reported to have been applied to the landfill 2 to 3 years after closure, it is unknown whether this amount was sufficient to cap the landfill and prevent future runoff (Marchiori 1989).

FIT did not sample surface water at the SSI stage. Because other industry is present along the river, attribution of potential contami-

nation of the Des Plaines River to the Golf and River Landfill site would be difficult.

The Des Plaines River is used for fishing and canoeing, although recreational use is rare in the area of the landfill (Marie 1989; Rockford Map Publishers 1983).

5.4 AIR

A release of potential contaminants to the air was not documented during the SSI of the Golf and River Landfill site. During the reconnaissance inspection, FIT site-entry instruments (OVA 128, hydrogen cyanide detector, and explosimeter) did not detect levels above background concentrations at the site. In accordance with the U.S. EPA-approved work plan, further air monitoring was not conducted by FIT.

The potential for windblown particulates to carry contaminants from the site is very low because the site is covered by vegetation.

5.5 FIRE AND EXPLOSION

During the reconnaissance inspection, FIT site-entry instruments (explosimeter) did not indicate explosive conditions at the Golf and River Landfill site. According to Mark Hansen, an inspector with the Fire Prevention Bureau of the Des Plaines Fire Department, no response activities have taken place and no fire or explosion threat currently exists at the site (Hansen 1989).

5.6 DIRECT CONTACT

According to federal, state, and local file information reviewed by FIT, there is no documentation for an incident of direct contact with TCL compounds or TAL analytes at the Golf and River Landfill site.

There is a potential that the public may come into direct contact with TCL compounds and TAL analytes detected at the Golf and River Landfill site, based on the following information:

- The perimeter of the site is unfenced and the site is accessible; and

- TCL compounds (including PAHs) and TAL analytes were detected in on-site soils at depths of 1 to 6 inches.

The population within a 1-mile radius of the site is approximately 3,262 persons. This figure includes the 60 year-round residents of The Sisters of the Holy Family of Nazareth Convent, the 180 year-round residents of Maryville Academy, and the 5% of the population of Des Plaines that falls within a 1-mile radius of the site. The figure also includes those persons outside the corporate boundaries of Des Plaines but within the 1-mile radius; calculated by multiplying house counts from USGS topographic maps (USGS 1963) by the 2.75 persons-per-household average for Cook County (U.S. Bureau of the Census 1982).

01 ■ J. DAMAGE TO FLORA — 02 ☐ OBSERVED (DATE _____) ■ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

SEE SECTION 3.3
BECAUSE of the month (early April) FIT could not observe if vegetation was stressed.

01 ■ K. DAMAGE TO FAUNA — 02 ☐ OBSERVED (DATE _____) ■ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION (Include name(s) of species)

SEE SECTION 3.3

01 ■ L. CONTAMINATION OF FOOD CHAIN — 02 ☐ OBSERVED (DATE _____) ■ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

POTENTIAL IS LOW TO NONE.

01 ■ M. UNSTABLE CONTAINMENT OF WASTES — 02 ☐ OBSERVED (DATE: _____) ■ POTENTIAL ☐ ALLEGED
(Spills, Runoff, Standing liquids, Leaking drums)
03 POPULATION POTENTIALLY AFFECTED: Unknown — 04 NARRATIVE DESCRIPTION

File information does not indicate the presence of a man-made liner. SEE SECTION 5.2.

01 ■ N. DAMAGE TO OFFSITE PROPERTY — 02 ☐ OBSERVED (DATE: _____) ■ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

Des Plaines River could be impacted by on-site contamination.

01 ■ O. CONTAMINATION OF SEWERS, STORM DRAINS, WWTPs — 02 ☐ OBSERVED (DATE: _____) ■ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

Several Sewer-Like Structures on-site, including a drainage ditch, SEE APPENDIX C. Northwest Water Commission has water lines running through the landfill. SEE SECTION 2.3.

01 ■ P. ILLEGAL/UNAUTHORIZED DUMPING — 02 ■ OBSERVED (DATE: 4-4-89) ■ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

Mixed municipal debris observed at the time of the SSI. SEE SECTION 3.3.

05 DESCRIPTION OF ANY OTHER KNOWN, POTENTIAL, OR ALLEGED HAZARDS

SEE SECTION 2.3 ON water lines running through the landfill from the Northwest Water Commission.

III. TOTAL POPULATION POTENTIALLY AFFECTED: 3-mile radius on Groundwater: 2,504

IV. COMMENTS

1-mile radius of ~3,262 is also potentially affected for the Direct Contact pathway.

06 AREA OF SITE
~20 (Acres)

07 COMMENTS

A Final Cover of 24" of unknown material was laid down on the landfill for closure in 1970, indicated to be supervised by the IEPA and/or IDPH. The cover is indicated to have been laid down by Sanitary Improvement, Co. 2-3 years after closure, J.S. ADAMS laid down 35-40 truckloads of clean earth and clay material to combat erosion.

IV. CONTAINMENT

01 CONTAINMENT OF WASTES (Check one)

☐ A. ADEQUATE, SECURE ■ B. MODERATE/Unknown ☐ C. INADEQUATE, POOR ☐ D. INSECURE, UNSOUND, DANGEROUS

02 DESCRIPTION OF DRUMS, DIKING, LINERS, BARRIERS, ETC.

File information does not indicate the presence of a man-made liner. The site was in operation since circa 1955, when little to no regulation existed.

V. ACCESSIBILITY

01 WASTE EASILY ACCESSIBLE: ■ YES ☐ NO

02 COMMENTS

Contamination found in surface soils at 1-6 inches.
